COVID-19 Literature Digest – 16/10/2020

Dear all,

This week’s guest editor is Dr André Charlett who heads PHE’s Statistics, Modelling and Economics Department and is currently working within the PHE Joint Modelling Cell.

If you only read three papers this week...

We are currently observing widespread, increasing incidence of SARS-CoV-2 across England. Understanding transmission is critical to enable effective control measures to be instigated, and the three papers I have picked hang together around this theme.

Concerns around SARS-CoV-2 transmission as students from across the country return to universities have been subject to a large amount of deliberation. A recent paper in MMWR describes the epidemiology of 18 to 22 year old adults in the USA. During the period August 2 to September 5, COVID-19 cases increased by 55% nationally in persons aged 18 to 22 years old, with heterogeneity observed between regions. Increases in reported incidence and test positivity were absent in other age groups. Some of this increase is likely to reflect ascertainment from increased testing. However, the picture presented shows increasing case numbers in the age group containing most university students. Mitigation and preventive measures targeted to young adults is recommended.

The question of whether super-spreading events (SSEs) “kick-started” this pandemic has been studied by Wang et al. Using phylogenetic analyses of 208 sequences from the initial phase of the outbreak in China, they estimate the offspring distribution. This is the distribution of the number of secondary cases caused by each case, the mean of which provides an estimate of $R_0$. Assuming a negative binomial model for this distribution, they estimate the mean to be 1.23 (95% credible interval (CI) 1.09 to 1.39) and the variance 8.35 (95% CI 5.06 to 13.39). The dispersion estimate for this distribution was 0.23 (95% CI 0.13 to 0.39), providing a strong indication of SSEs during the initial phase. Results are in line with SARS and Ebola, for which SSEs are well recognised. This study highlights the importance of recognising such events in the initial stages, as they can greatly aggravate the spread of COVID-19.

Finally, a very interesting analysis of an outbreak in a German meat packing plant is provided by Gunther et al. This is also shown to be a SSE with an index case in May, who caused 27 secondary cases among fellow early shift workers. They describe a situation of limited ability to social distance due to production needs, low levels of air exchange, and physically demanding work leading to heavy breathing. Notable is distances in excess of 8 metres over which infections were transmitted in this environment, with their analysis pointing towards aerosol rather than droplet transmission. Eventually a total of 1,413 cases were detected in this outbreak.

André
Please find today's report below.

PHE’s COVID-19 Literature Digest has been produced since February 2020. A selection of our previous Digests can be found here. This resource aims to highlight a small selection of recent COVID-19 papers that are relevant to UK settings, contains new data / insights or emerging trends. The Digest team generate a report three times per week (Mon, Wed, Fri), which includes both preliminary reports of work (preprints) that have NOT been peer-reviewed and research that has been subject to peer review and wider scrutiny. The Digest is very rapidly produced and does not claim to be a perfect product; the inclusion or omission of a publication should not be viewed as an endorsement or rejection by PHE. We do not accept responsibility for the availability, reliability or content of the items included in this resource.

To join our email distribution list please send a request to COVID.LitDigest@phe.gov.uk. If you are interested in papers relating to behaviour and social science please contact COVID19.behaviouralscience@phe.gov.uk to sign up to receive the PHE Behavioural Sciences Weekly Report.

Best wishes,

Bláthnaid Mahon, Emma Farrow, James Robinson
On behalf of the PHE COVID-19 Literature Digest Team

Report for 16.10.2020 (please note that papers that have NOT been peer-reviewed are highlighted in red).

Sections:
- Serology and immunology
- Diagnostics
- Epidemiology and clinical – children / pregnancy
- Epidemiology and clinical – risk factors
- Epidemiology and clinical – long term complications / sequelae
- Epidemiology and clinical – other
- Infection control / non-pharmaceutical interventions
- Treatment
- Vaccine development
- Modelling
- Guidance and consensus statements (no digest)
- Overviews, comments and editorials (no digest)

### Serology and immunology

| 13.10.2020 | Orthogonal SARS-CoV-2 Serological Assays Enable Surveillance of Low Prevalence Communities and Reveal Durable Humoral Immunity | Immunity / Report                           | • Conducted a serological study to define correlates of immunity against SARS-CoV-2. Relative to mild COVID-19 cases, individuals with severe disease exhibited elevated virus-neutralizing titres and antibodies against nucleocapsid (N) and the receptor binding domain (RBD) of spike protein. Age and sex played lesser roles.  
  • Inclusion of multiple independent assays improved the accuracy of antibody tests in low seroprevalence communities and revealed differences in antibody kinetics depending on the antigen.  
  • Conclude that neutralizing antibodies are stably produced for at least 5-7 months after SARS-CoV-2 infection. |
| 08.10.2020 | Persistence of serum and saliva antibody responses to SARS-CoV-2 spike antigens in COVID-19 patients | Sci Immunol / Article                       | • Profiled IgG, IgA and IgM responses to the SARS-CoV-2 spike protein and its receptor-binding domain (RBD) in serum and saliva of acute and convalescent patients with laboratory-diagnosed COVID-19 ranging from 3–115 days post-symptom onset (PSO), compared to negative controls.  
  • This study confirms that serum and saliva IgG antibodies to SARS-CoV-2 are maintained in the majority of COVID-19 patients for at least 3 months PSO. IgG responses in saliva may serve as a surrogate measure of systemic immunity to SARS-CoV-2 based on their correlation with serum IgG responses. |
| 08.10.2020 | Persistence and decay of human antibody responses to the receptor binding domain of SARS-CoV-2 spike protein in COVID-19 patients | Sci Immunol / Article                       | • Measured plasma and/or serum antibody responses to the receptor-binding domain (RBD) of the spike (S) protein of SARS-CoV-2 in 343 North American patients infected with SARS-CoV-2 (of which 93% required hospitalization) up to 122 days after symptom onset and compared them to responses in 1548 individuals whose blood samples were obtained prior to the pandemic.  
  • Data suggest that RBD-targeted antibodies are excellent markers of previous and recent infection, that differential isotype measurements can help distinguish between recent and older infections, and that IgG responses persist over the first few months after infection and are highly correlated with neutralizing antibodies.  
  • Observed no cross-reactivity of the SARS-CoV-2 RBD-targeted antibodies with other widely circulating coronaviruses (HKU1, 229 E, OC43, NL63). |
| 13.10.2020 | Healthcare workers with mild / asymptomatic SARS-CoV-2 infection show T cell responses and neutralising antibodies after the first wave | medRxiv (non-peer reviewed) / Article       | • Cross-sectional, case-control study of 136 healthcare workers (HCW) at 16-18 weeks after UK lockdown, with 76 having had laboratory-confirmed SARS-CoV-2 mild or asymptomatic infection.  
  • Data suggests the majority of HCW with mild or asymptomatic SARS-CoV-2 infection carry neutralising antibodies complemented by multi-specific T cell responses for at least 4 months after mild or asymptomatic SARS-CoV-2 infection. |
| 13.10.2020 | IgM autoantibodies recognizing ACE2 are associated with severe COVID-19 | medRxiv (non-peer reviewed) / Article       | • Demonstrates robust IgM autoantibodies that recognize angiotensin converting enzyme-2 (ACE2) in 18/66 (27%) patients with severe COVID-19, which are rare (2/52; 3.8%) in hospitalised patients who are not ventilated.  
  • The antibodies do not undergo class-switching to IgG, suggesting a T-
independent antibody response.

- Pathological analysis of lung obtained at autopsy shows endothelial cell staining for IgM in blood vessels in some patients.
- Authors propose that vascular endothelial ACE2 expression focuses the pathogenic effects of these autoantibodies on blood vessels, and contributes to the angiocentric pathology observed in some severe COVID-19 patients.

| 15.10.2020       | Synthesis and systematic review of reported neonatal SARS-CoV-2 infections                                                                                                                                 | Nature Communications / Article | • Present a meta-analysis of 176 published cases of neonatal SARS-CoV-2 infections that were defined by at least one positive nasopharyngeal swab and/or the presence of specific IgM.  
• 70% and 30% of infections are due to environmental and vertical transmission.  
• 55% of infected neonates developed COVID-19; the most common symptoms were fever (44%), gastrointestinal (36%), respiratory (52%) and neurological manifestations (18%), and lung imaging was abnormal in 64% of cases.  
• A lack of mother–neonate separation from birth is associated with late SARS-CoV-2 infection, while breastfeeding is not. |
| 13.10.2020       | Clinical characteristics, symptoms, management and health outcomes in 8,598 pregnant women diagnosed with COVID-19 compared to 27,510 with seasonal influenza in France, Spain and the US: a network cohort analysis                                                                 | medRxiv (non-peer reviewed) / Article | • Examined aspects of COVID-19 in pregnant women (8,598 women diagnosed with COVID-19, of which 2,031 hospitalised), and in comparison to pregnant women with influenza.  
• Comorbidities more prevalent with COVID-19 hospitalisation (compared to COVID-19 diagnosed) in pregnancy included renal impairment (2.2% diagnosed vs 5.1% hospitalised) and anaemia (15.5% diagnosed vs 21.3% hospitalised).  
• Multiple medications were used to treat pregnant women hospitalised with COVID-19, some with little evidence of benefit.  
• Anosmia and dyspnea were indicative symptoms of COVID-19 in pregnancy |
compared to influenza.
- Despite low fatality (N<5 in each of 6 databases), pregnancy and maternal outcomes were worse in COVID-19 than influenza.

| 11.10.2020       | What is the evidence for transmission of COVID-19 by children in schools? A living systematic review | medRxiv (non-peer reviewed) / Article | • Investigates the extent of SARS-CoV-2 transmission in schools (2,178 articles retrieved, 11 studies included).
  • Five cohort studies reported a combined 22 student and 21 staff index cases that exposed 3,345 contacts with 18 transmissions [overall infection attack rate (IAR): 0.08% (95% CI: 0.00%-0.86%)]. IARs for students and school staff were 0.15% (95% CI: 0.00%-0.93%) and 0.70% (95% CI: 0.00%-3.56%) respectively.
  • Six cross-sectional studies reported 639 SARS-CoV-2 positive cases in 6,682 study participants tested [overall positivity rate: 8.00% (95% CI: 2.17%-16.95%)].
  • Positivity rate was estimated to be 8.74% (95% CI: 2.34%-18.53%) among students, compared to 13.68% (95% CI: 1.68%-33.89%) among school staff.
  • Overall, study quality was judged to be poor with risk of performance and attrition bias. |

### Epidemiology and clinical – risk factors

| 01.01.2021       | Superspreading Event of SARS-CoV-2 Infection at a Bar, Ho Chi Minh City, Vietnam | Emerg Infect Dis / Letter (early release) | • Report a superspreading event of SARS-CoV-2 infection initiated at a bar in Vietnam with evidence of symptomatic and asymptomatic transmission, based on ministry of health reports, patient interviews, and whole-genome sequence analysis.
  • Crowds in enclosed indoor settings with poor ventilation may be considered at high risk for transmission. |
| 13.10.2020       | Nightlife clusters of coronavirus disease in Tokyo between March and April 2020 | Epidemiol Infect / Article | • Collected clinical and epidemiological information of the patients who underwent SARS-CoV-2 PCR testing at the National Centre for Global Health and Medicine, Tokyo, from 9 Mar to 26 Apr 2020. A nightlife group was defined as those who had worked at or visited the businesses.
  • Included 1517 individuals; 196 (12.9%) were categorized as the nightlife group. The proportion of positive test results in the nightlife group was significantly higher than that in the non-nightlife group after matching (nightlife, 63.8%; non-nightlife, 23.0%).
  • Exposure to nightlife businesses was significantly associated with positive SARS-CoV-2 PCR test results. |

• Local clusters of infection were identified within the target population, and appeared to correlate with higher indices of deprivation, poorer overall health and high household occupancy.  
• The authors suggest a role for targeted public health measures in more deprived areas. |
| 07.10.2020       | Low zinc levels at clinical admission associates with poor outcomes in COVID-19 | medRxiv (non-peer reviewed) / Article | • Study of 249 COVID-19 patients admitted to a Spanish hospital investigated whether serum zinc content influences COVID-19 disease progression and thus might represent a useful biomarker.  
• Serum zinc levels lower than 50 mcg/dl at admission correlated with worse clinical presentation, longer time to reach stability, and higher mortality.  
• In vitro results indicate that low zinc levels favour viral expansion in SARS-CoV2 infected cells. |
| 13.10.2020       | Impact of COVID-19 on Obesity Management Services in the United Kingdom (The COMS-UK study) | Obes Surg / Brief communication | • This study found that the COVID-19 pandemic has had a severe impact on the services involved in the management of patients suffering from severe, complex obesity in the UK. |

| 15.10.2020       | Living with Covid-19 | NIHR / Themed review | • This rapid and dynamic review draws on the lived experience of patients and expert consensus as well as published evidence to better understand the impact of ongoing effects of Covid-19, how health and social care services should respond, and what future research questions might be.  
• There is a widespread perception that people either die, get admitted to hospital or recover after two weeks.  
• A major obstacle is the lack of consensus on diagnostic criteria for ongoing Covid-19.  
• The fluctuating and multisystem symptoms need to be acknowledged. |
| 13.10.2020       | Persistent symptoms after Covid-19: qualitative study of 114 long Covid patients and draft quality criteria for services | medRxiv (non-peer reviewed) / Article | • Qualitative study (n = 59; female = 70%) investigating patient experiences of long Covid, accounts of accessing and receiving healthcare, and ideas for improving services.  
• Themes raised include: a sense of loss and stigma; difficulty accessing and navigating services; difficulty achieving a diagnosis; disjointed and siloed care; variation in standards; variable quality of the therapeutic relationship; and possible |
critical events (e.g. deterioration after being unable to access services).
• Authors put forward several quality principles for a long Covid service.

16.10.2020 Epidemiological changes on the Isle of Wight after the launch of the NHS Test and Trace programme: a preliminary analysis

Lancet Digital Health / Article

• This paper was previously included in the Digest as a preprint.
• The aim of the study was to make a preliminary assessment of the epidemiological impact of the Test and Trace programme using publicly available data.
• Results show that the epidemic on the Isle of Wight was controlled quickly and effectively after the launch of Test and Trace.
• Findings highlight the need for further research to determine the causes of the reduction in the spread of the disease, as these could be translated into local and national non-pharmaceutical intervention strategies in the period before a treatment or vaccination for COVID-19 becomes available.

13.10.2020 School closures and SARS-CoV-2. Evidence from Sweden's partial school closure

medRxiv (non-peer reviewed) / Article

• Compares parents and teachers differently exposed to either open and closed schools during the COVID-19 pandemic in Sweden, but otherwise facing similar conditions.
• Among parents, exposure to open rather than closed schools resulted in a small increase in PCR-confirmed infections [OR 1.15; CI95 1.03-1.27].
• Among lower secondary teachers the infection rate doubled relative to upper secondary teachers [OR 2.01; CI95 1.52-2.67], spilling over to the partners of lower secondary teachers who had a higher infection rate than their upper secondary counterparts [OR 1.30; CI95 1.00-1.68].
• When analysing COVID-19 diagnoses from healthcare visits and the incidence of severe health outcomes, results are similar for teachers but somewhat weaker for parents and teachers' partners.

| 15.10.2020      | Repurposed antiviral drugs for COVID-19; interim WHO SOLIDARITY trial results | medRxiv (non-peer reviewed) / Article | • Mortality trials in hospitalised COVID-19 of four re-purposed antiviral drugs.  
• Across 30 countries, 11,266 adults were randomised to Remdesivir (n=2750), Hydroxychloroquine (n=954), Lopinavir (n=1411), Interferon (n=1412), Interferon plus Lopinavir (n=651), or no study drug (n=4088).  
• Remdesivir, Hydroxychloroquine, Lopinavir and Interferon regimens appeared to have little or no effect on hospitalized COVID-19, as indicated by overall mortality, initiation of ventilation and duration of hospital stay.  
• The mortality findings contain most of the randomised evidence on Remdesivir and Interferon, and are consistent with meta-analyses of mortality in all major trials. |
## Vaccine development
